

PANDALIME — PROJECT ABSTRACT

AI Resume Scanner, Portfolio Builder & Career Suite

Project Report
URL: pandalime.com
Host: Render | DB: Neon PostgreSQL

1. Project Overview & Problem Statement

When people apply for jobs today, their resumes are almost never read by a human first. Instead, over 90% of mid-to-large companies use automated software called **Applicant Tracking Systems (ATS)** (like Workday, Taleo, Greenhouse, and Lever). These systems scan resumes for specific keywords, skills, and formatting. If a candidate misses important terms or uses complex layouts, the computer rejects their application automatically.

PandaLime (pandalime.com) is a free web platform built to solve this problem simply and directly. It acts as an instant career assistant with two main tools: (1) an **AI Resume Scanner** that checks resumes against real job descriptions and shows how to fix them, and (2) an **AI Portfolio Builder** that turns resume information into a clean, published personal website with one click.

100% Free & No Sign-Up	Instant 3-Second AI Review	1-Click Live Portfolio
No paywalls or subscriptions. Anyone can run full scans and test tools immediately without forced registration.	Uses Google Gemini AI to analyze full resumes and job postings in 3 to 5 seconds with clear scores.	Generates a live developer website at pandalime.com/p/yourname , ready to share with recruiters.

2. How the Resume Scanner Works (Step-by-Step)

The scanning process is straightforward and fast:

Step 1: Upload & Text Extraction	The user uploads their resume as a PDF and pastes a target job description. The server reads the PDF file and extracts the plain text cleanly.
Step 2: File Safety Verification	The backend checks the binary header (%PDF- magic bytes) to make sure the file is genuinely a safe PDF, blocking dangerous scripts and keeping user data safe.
Step 3: Google Gemini AI Comparison	Google's Gemini AI reads both the resume and the job description. It looks for missing technical tools, programming languages, soft skills, and required experience.
Step 4: Score & Practical Fixes	The user receives an instant report with: • ATS Match Score (0 to 100): How well the resume fits the role. • Missing Keywords: Essential skills found in the job posting that should be added. • Rewritten Bullets (Google X-Y-Z formula): Weak sentences turned into <i>'Accomplished [X] by doing [Z], resulting in [Y]'</i>. • Formatting Warnings: Alerts if tables or multi-column layouts might confuse older ATS parsers.

3. AI Portfolio Builder (Personal Website in 1 Click)

PandaLime includes an **AI Portfolio Builder** that turns a user's resume or work history into a published personal website:

Custom Shareable Link: Every user gets a personal web address (such as pandalime.com/p/yourname) to put on LinkedIn, GitHub, or emails.	Recruiter-Ready Sections: Includes project cards with live links, skill badges, job timeline, and a button to download the PDF resume.
Simple Themes: Clean styles (Terminal, Minimal Light, Modern Dark) that look great on phones and computers.	Stored in Neon DB: Profiles and published portfolios are safely stored in a serverless PostgreSQL database (Neon DB) for instant loading.

4. Technologies Used (Simple Explanation)

The platform uses modern, reliable web technologies chosen for fast loading, simplicity, and safety:

Part of the Site	Technology Used	What It Does (In Simple Words)
Frontend (UI)	React 18 + Vite + Tailwind CSS	Builds the user interface so pages load instantly, look clean, and work smoothly on mobile phones and computers.
Backend Server	Node.js + Express	Receives uploaded files, validates PDFs safely, coordinates AI requests, and runs REST APIs.
Database	Neon DB (PostgreSQL)	Serverless PostgreSQL database that stores user accounts, saved scan reports, and published portfolios.
Artificial Intelligence	Google Gemini AI	Acts like an experienced recruiter: compares resume text with job requirements, finds skill gaps, and rewrites bullet points.
Cloud Hosting	Render Cloud Platform	Hosts both the Frontend web app and Backend API services on Render with automatic deployments, health checks, and global SSL.
Speed & SEO	Static Site Generation (SSG)	Pre-renders 235+ static pages (including 12 career blog guides and 6 regional language hubs) so pages load in milliseconds.
Security & Anti-Abuse	HMAC CAPTCHA & Rate Limits	Stops spam bots using simple mathematical human challenges, strict IP rate limiters, and URL sanitization.

5. Extra Free Built-in Career Tools

• STAR Bullet Generator: Helps users write achievement bullet points using Situation, Task, Action, and Result. • 250+ ATS Action Verbs: Organized library of strong power verbs for engineering, leadership, and management.	• Job Keyword Extractor: Instant tool that pulls out required hard skills and tools from any job posting. • 6 Regional Language Hubs: Translated portals in Hindi, Tamil, Telugu, Kannada, Marathi, and Bengali.
---	--

6. Project Summary

PandaLime brings together Google Gemini AI intelligence, fast React web design, and serverless Neon PostgreSQL storage on Render. Its goal is simple: take the mystery out of automated resume screening and give job seekers an easy, free way to optimize their resumes and showcase their work with confidence.
